

Map one source field to one target  
field

The default mapping behavior maps one source field to one target field. For example, map the **Name** field to the **CustomerName** field.

#### *Procedure*

1. In the **Sources** panel, click the data field that you want to map from.

You might need to expand a folder to see the data fields that it provides.

When there are many source fields, you can search for the field of interest by clicking the [Magnifying Glass] and entering the name of the data field in the search field.

2. In the **Target** panel, click the data field that you want to map to.

The data mapper displays a line that connects the two fields that you just selected.

3. Optionally, preview the data mapping result. This is useful when you add a transformation to the mapping or when the mapping requires a type conversion.
  - a. In the upper right of the data mapper, click [Editor settings] and select **Show Mapping Preview** to display a text input field on the source field and a read-only result field on the target field.
  - b. In the source field's data input field, enter text. Click somewhere outside this text box to display the mapping result in the read-only field on the target field.
  - c. Optionally, to see the result of a transformation, add a transformation in the **Mapping Details** panel.
  - d. Hide the preview fields by clicking [Editor settings] again and selecting **Show Mapping Preview**.
4. Optionally, to confirm that the mapping is defined, in the upper right, click [Grid] to display the defined mappings.

You can also preview data mapping results in this view. If preview fields are not visible, click [Editor settings] and select **Show Mapping Preview**. Enter data as described in the previous step. In the table of defined mappings, preview fields appear for only the selected mapping. To see preview fields for another mapping, select it.

Click [Grid] again to display the data field panels.

5. In the upper right, click **Done** to save the mapping.

#### *Alternative procedure*

Here is another way to map a single source field to a single target field:

1. In the **Configure Mapper** page, in the upper right, click the plus sign to display the **Mapping Details** panel.
2. In the **Sources** section, enter the name of the source field.
3. In the **Action** section, accept the default **Map** action.
4. In the **Target** section, enter the name of the field that you want to map to and click **Enter**.
