

In the data mapper, after you define a mapping, you can transform any field in the mapping. Transforming a data field defines how you want to store the data. For example, you could specify the **Capitalize** transformation to ensure that the first letter of a data value is uppercase.

Procedure

- 1. Map the fields. This can be a one-to-one mapping, a combination mapping, or a separation mapping.
- 2. In the **Mapping Details** panel, under **Sources** or under **Targets**, in the box for the field that you want to transform, click the arrow that points to the trash can. This displays a field where you can select the transformation that you want the data mapper to perform.
- 3. Click in this field to display the list of transformations.
- 4. Click the transformation that you want to perform.
- 5. If the transformation requires any input parameters, specify them in the appropriate input fields.
- 6. To add another transformation, click the arrow that points to the trash can again.
